

# The tectonic stress field

# Why is stress important in petroleum engineering?

**Wellbore failure occurs because the stress around the well exceeds the strength of the rock.**

© American Geophysical Union, © Centek Publishing Image Source

**Faults will slip when the ratio of shear to normal stress on the fault exceeds its frictional strength.**

© USGS Image Source

**Reservoir depletion causes changes in the stress state at depth that can be beneficial, or detrimental, to production.**

# Reality

- Much more complicated!

# Sources of tectonic stress

# Plate driving stresses

- Tectonic plates are pushed by compressional forces from mid-ocean ridges
- Drag forces on the base of the plates
- Frictional resistance to subduction

# Topography and buoyancy forces

- Density anomalies
- Plate thinning
  - extension
- Plate thickening
  - compression

# Plate flexure

- Sediment loading on a techtonic plate
- Wavelength can be as long as 1000km
